Graph: Sportfiskarna

- Large-scale pelagic (fish meal) industry fishing fishing near the coast:

- Enormously large coastal catches
- size doesn't matter...
- neither does effect on local subpopulations...

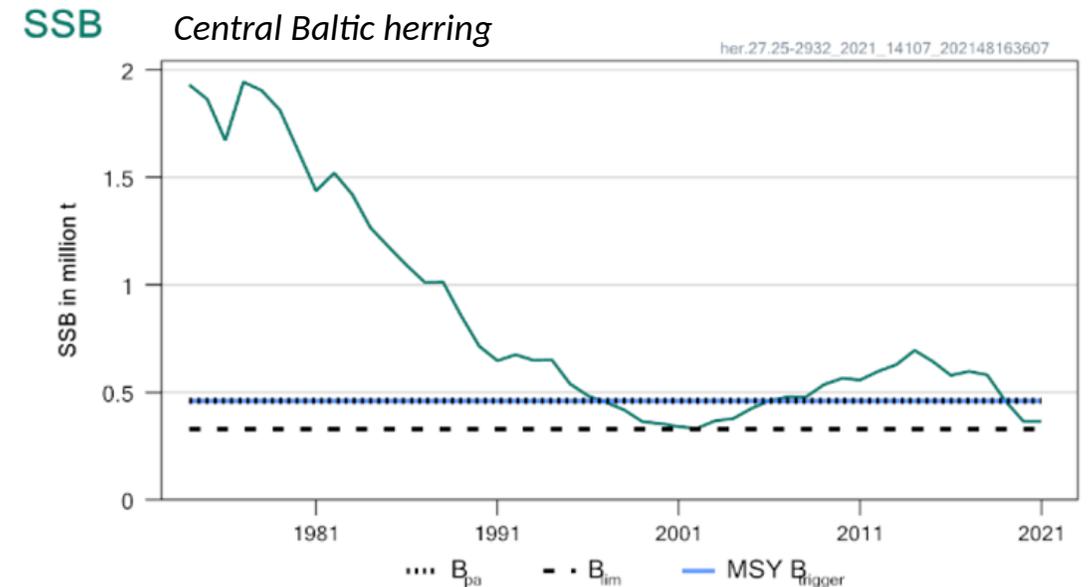

- Small-scalers:

- decreased catches
- almost no larger fish (necessary for human consumption)

- Scientist: disclaimer!

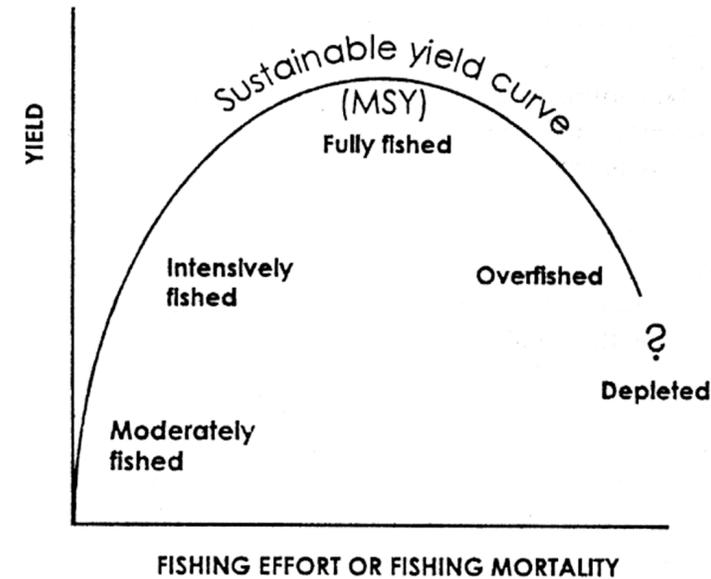

**DISCLAIMER**

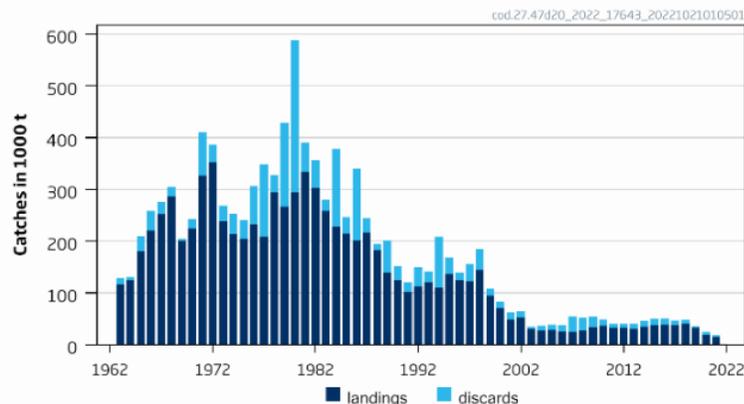

# Maximum "Sustainable" Yield (MSY)

- Production target, maximises yield
- Abundance dependant  $\square$  culling/cleansing to increase growth
- Decreases size, takes no consideration to size distribution
- Causes goal conflicts with other legislation
- Single-species management
- Reference values change over time, the MSY definition moves...
- Can be called "sustainable" even if stock is weak

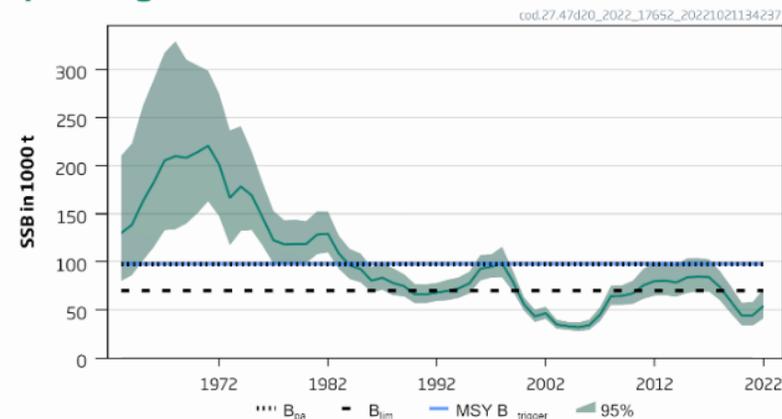

## North Sea cod stock

### Catches

### Spawning Stock Biomass

“ICES advises that when the MSY approach is applied, catches in 2023 should be no more than 26 008 tonnes.”

# Existing MSY management/advice vs...

- **EU Common Fisheries Policy (CFP)**  
“The objective of the CFP is to ensure that fishing and aquaculture activities contribute to long-term environmental, economic and social sustainability”, “ecosystem-based approach to fisheries management” and “achieving a good environmental status by 2020”
- **EU Multiannual Plans (MAPs)**  
 (“sustainable use”, “recovery”)
- **Marine Strategy Framework Directive (MSFD)**  
- “achieving a good environmental status by 2020”, age and size distribution, and more...
- **Precautionary principle**
- **Ecosystem-based fisheries**
- **Local populations**
- **Food web interactions**

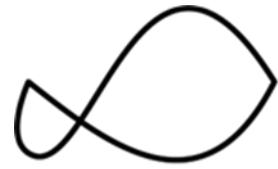

The screenshot shows the top navigation bar of the European Commission website. It includes the European Union flag logo, the text "English EN", a search box with a "Search" button, and a "Menu" dropdown. Below the navigation bar is a breadcrumb trail: "European Commission > EU Science Hub > MSFD Competence Centre > D3 Fisheries >". The main content area has a blue background with the heading "D3 Fisheries" and a sub-heading "Populations of all commercially exploited fish and shellfish are within safe biological limits, exhibiting a population age and size distribution that is indicative of a healthy stock." Below this, there is a paragraph of text: "The Marine Strategy Framework Directive (MSFD) is intended to "...contribute to coherence between different policies and foster the integration of environmental concerns into other policies, such as the Common Fisheries Policy (CFP)". To the right of this paragraph is a section titled "Implementation" with the sub-heading "Criteria & methodological standards". At the bottom of the page, there is a link: "The Common Fisheries Policy (CFP) ↗".

# The value of big fish

- ✓ **Biological/ecological**
  - ☐ top down-effect, resilience against eutrophication
  - ☐ high fecundity, the BOFFF-hypothesis
- ✓ **Genetical**
  - ☐ efficient fishery, no big fish, selection on early maturation
- ✓ **Recreational**
  - ☐ anglers often want big fish and travel very far for it
- ✓ **Economical**
  - ☐ bigger fish = better pay (fish meal industry trawlers the exception)
- ✓ **Social**
  - ☐ coastal communities, small-scale fisheries

# Including older fish in fisheries management – a new age-based indicator ( $ABI_{MSY}$ ) for exploited stocks

Christopher Griffiths, Henning Winker, Valerio Bartolino, Håkan Wennhage,

Alessandro Orio and Massimiliano Cardinale

E: [christopher.griffiths@slu.se](mailto:christopher.griffiths@slu.se)

T: @christophgriff5

# General themes

## 1. Age-structure ( $ABI_{MSY}$ )

- a) MSFD Descriptor 3 Criteria 3 of GES – ‘age and size distribution that is indicative of a healthy stock’
- b) General needs on sustainability, resilience and recovery

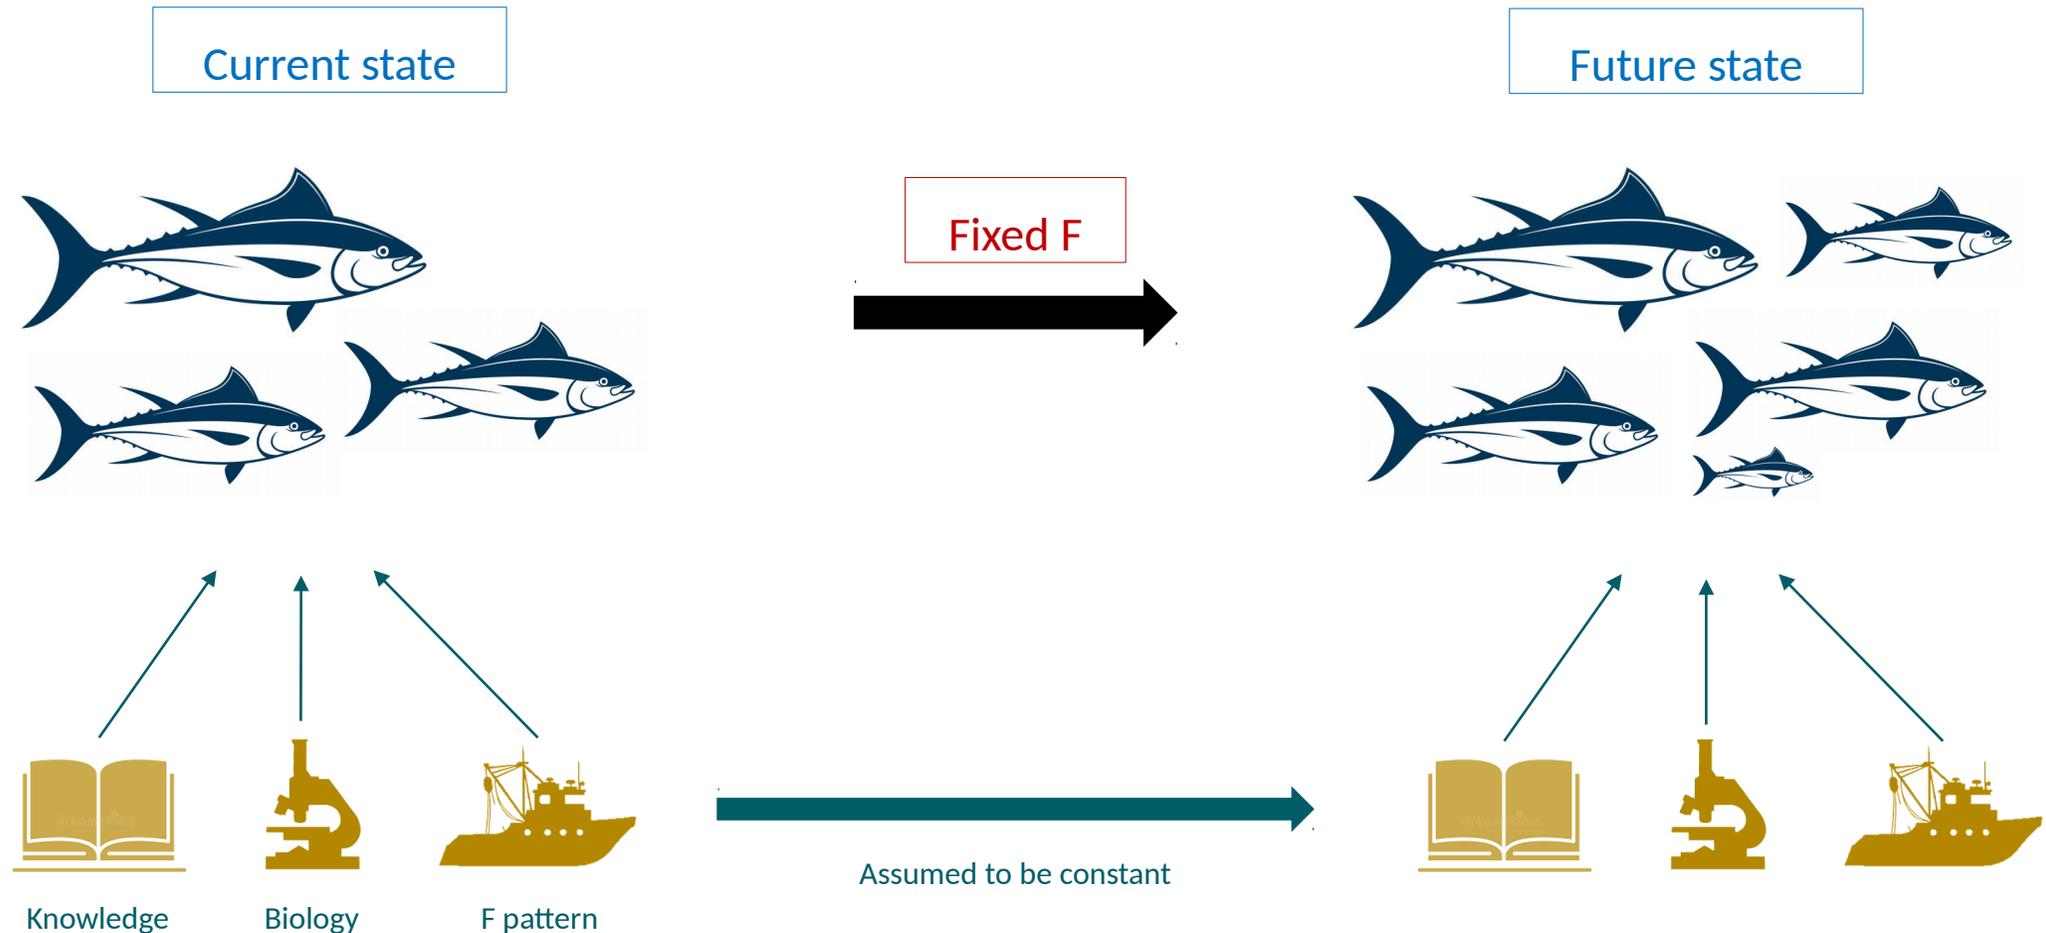

## 2. Can we fish differently?

- a) Shift in management targets/more precautionary
- b) What will reductions in  $F$  mean for long term yields?

stocks

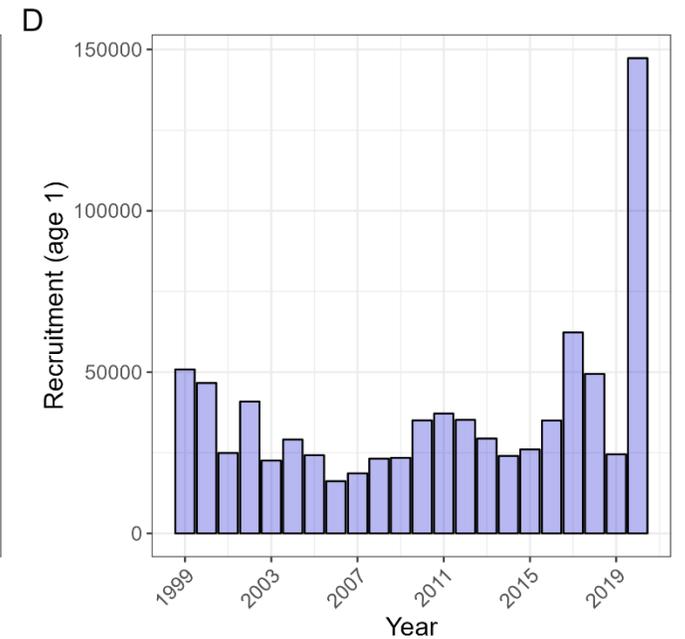

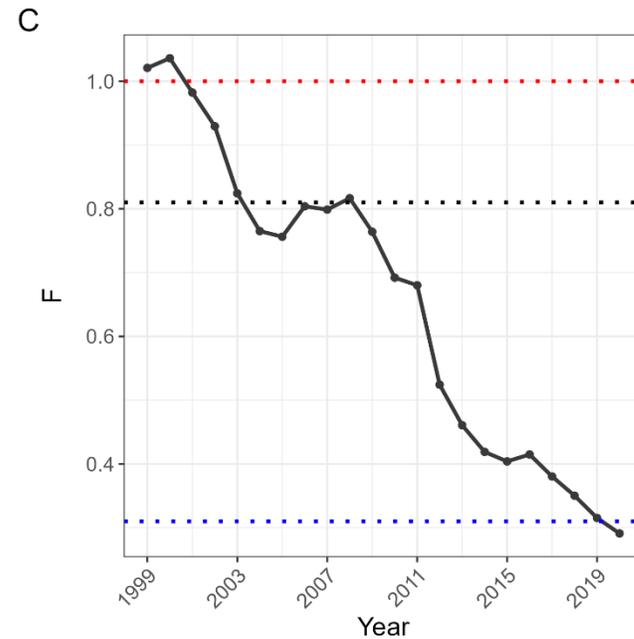

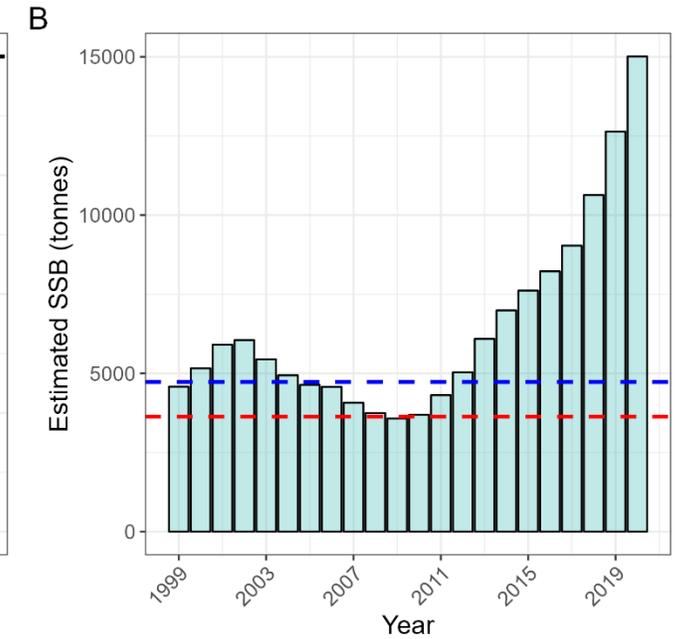

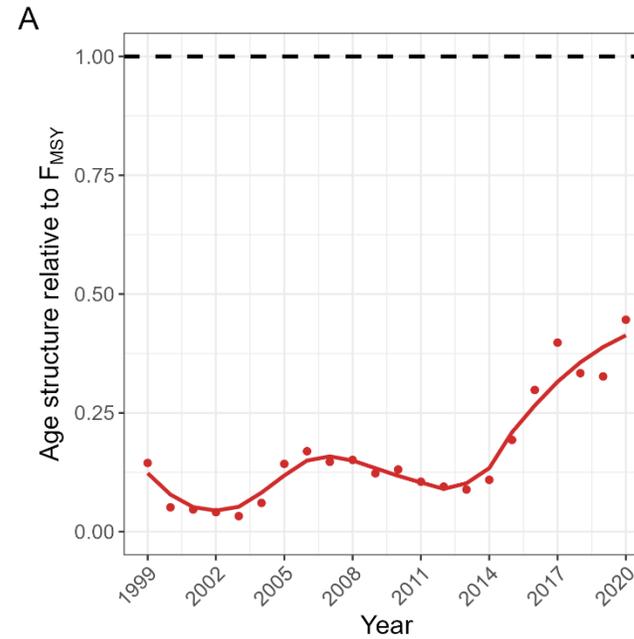

## European plaice in Baltic Sea (ple.27.21-23)

High SSB

Low F and declining

Low proportion of older fish

Indications of stock recovery but increasing F could lead to growth overfishing

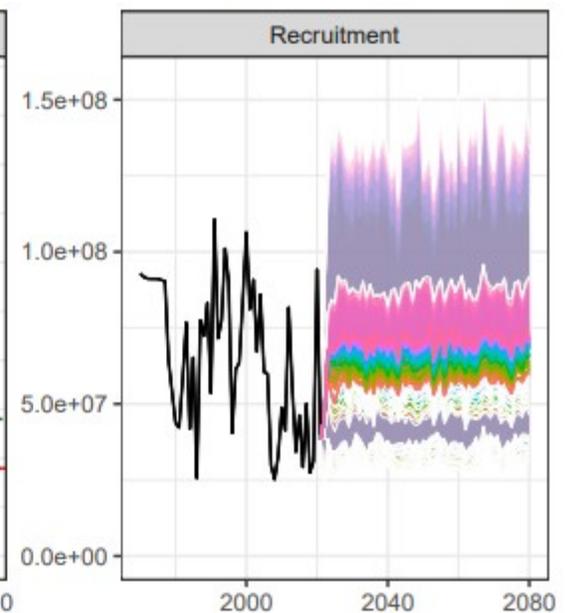

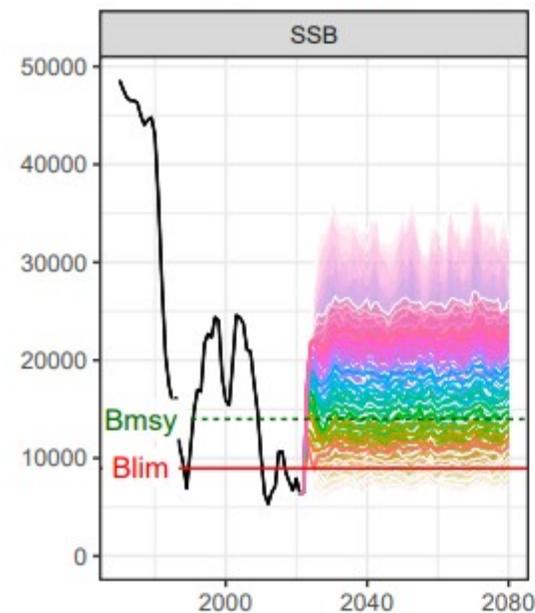

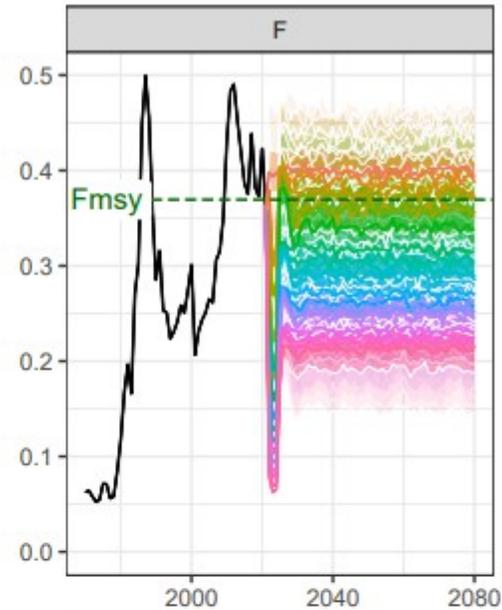

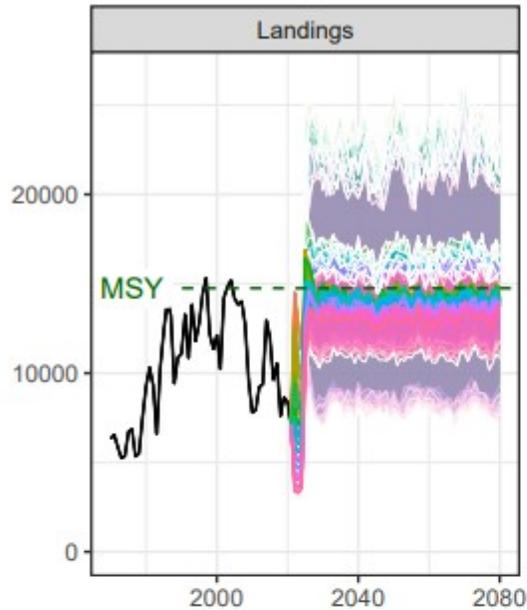

# Conclusions #1

- A.  $ABI_{MSY}$  provides information on the age structure of exploited stocks that aligns well with current ICES stock assessments and advice
- B. Meets the recommendations of the EU Commission and those described in the scientific literature for the MSFDs D3C3 of GES
- C. Has established reference points (age structure at  $F_{MSY}$ ) that match policy objectives
- D. Is perfectly placed to address two general needs in fisheries management:
  - Does a stock have the age structure it needs to sustain an advised level of catch?
  - Does a stock have enough older fish to recover as expected from fishing?

# Management Strategy Evaluations (MSEs)

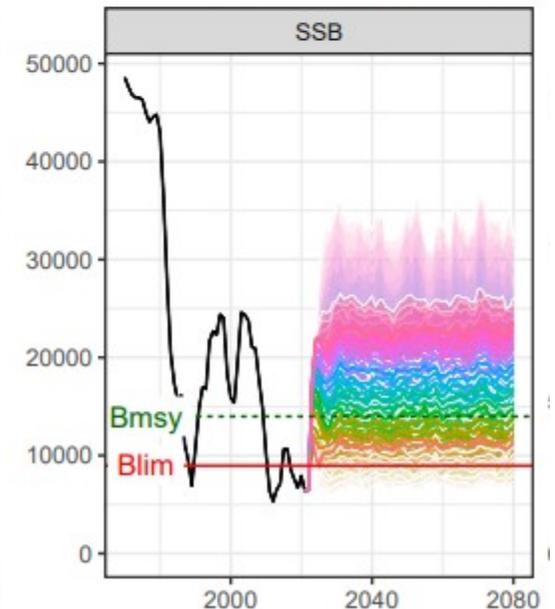

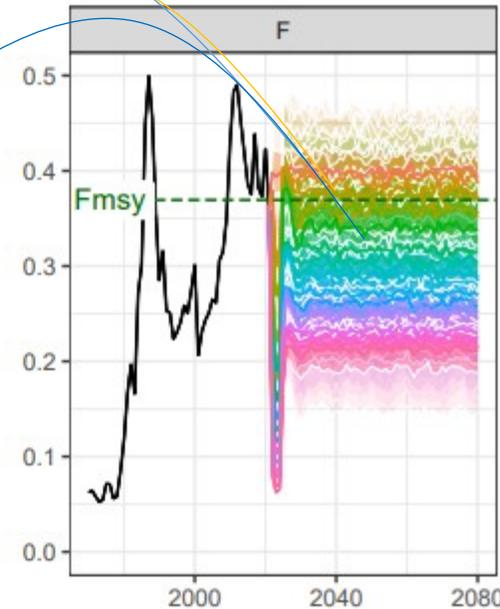

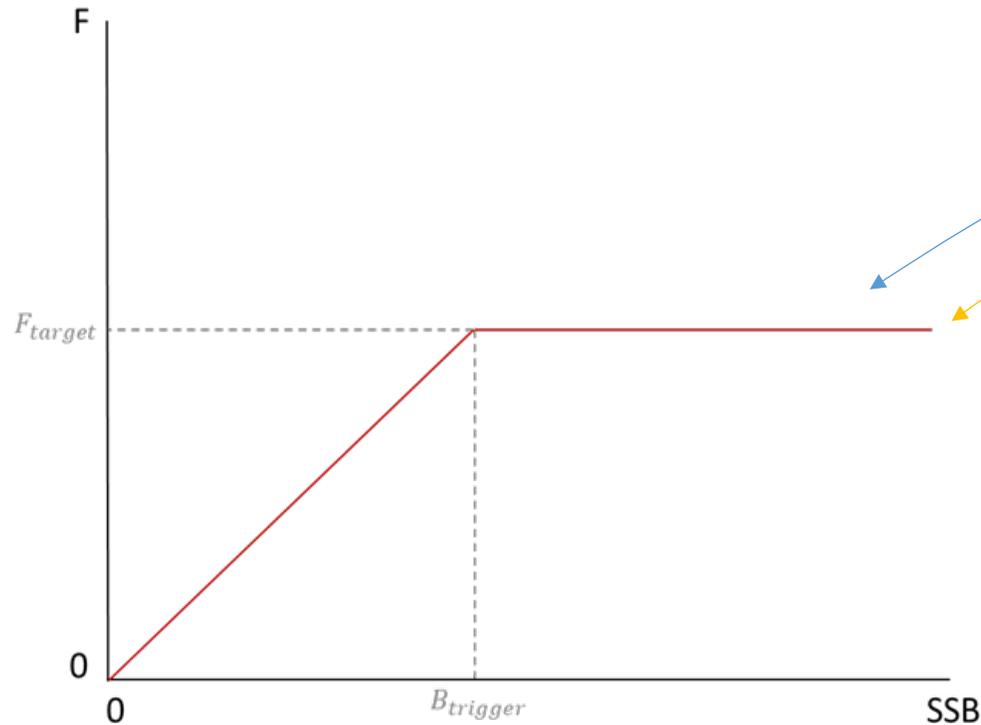

Estimation of reference points (management targets)

# Harvest Control Rules

HCR performance criteria:

1. The probability of SSB falling below  $B_{lim}$  in any single year should not exceed a 5% probability
2. High long-term yields should be achieved that, ideally, should correspond to fishing at  $F_{MSY}$

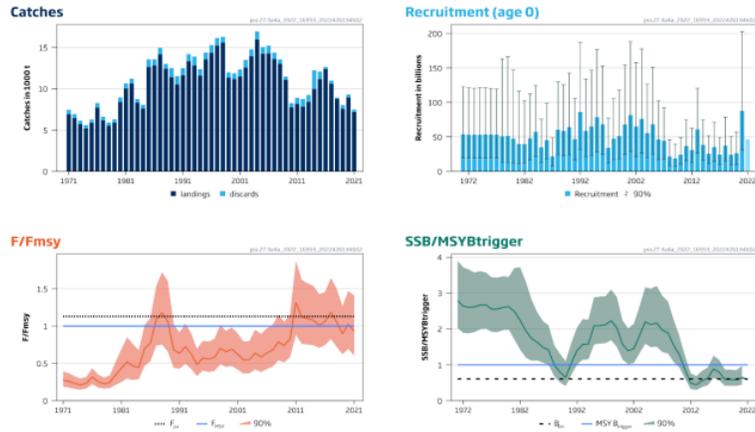

**Northern shrimp (*Pandalus borealis*) in divisions 3.a and 4.a East (Skagerrak and Kattegat and northern North Sea in the Norwegian Deep)**

**ICES advice on fishing opportunities**

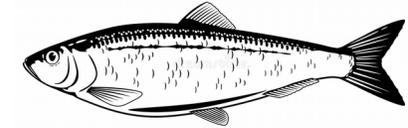

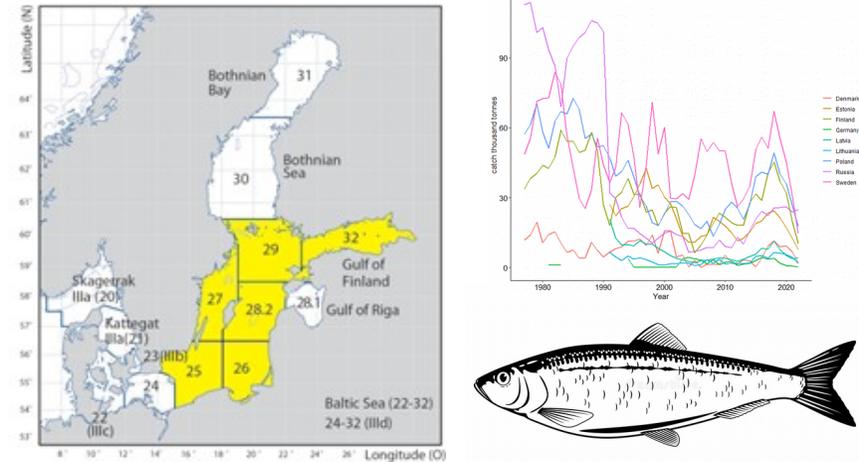

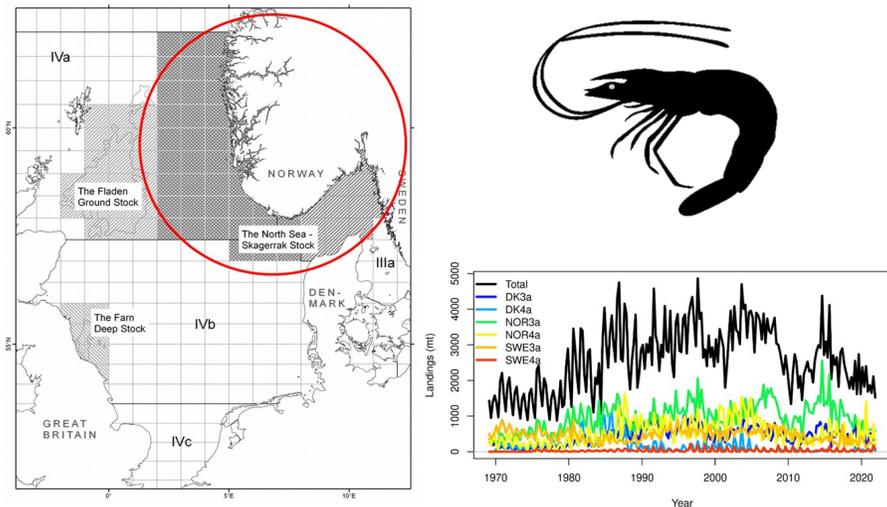

ICES advises that when the MSY approach is applied, catches should be no more than 7712 tonnes in 2022, and catches for the first six months of 2023 should be no more than 5882 tonnes.

**Stock development over time**

Fishing pressure on the stock is below  $F_{MSY}$ , and spawning-stock size is below  $MSY B_{trigger}$  and  $B_{pa}$  but above  $B_{lim}$ .

**Figure 1** Northern shrimp (*Pandalus borealis*) in divisions 3.a and 4.a East. Summary of the stock assessment. The assumed recruitment value for 2022 is shown in a lighter shade of blue. [Note:  $B_{pa} = MSY B_{trigger}$ ]. Spawning-stock biomass (SSB) is the biomass of mature females.

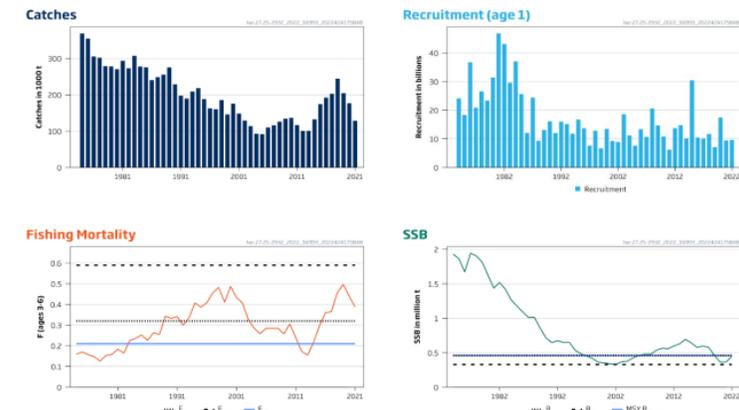

**Herring (*Clupea harengus*) in subdivisions 25–29 and 32, excluding the Gulf of Riga (central Baltic Sea)**

**ICES advice on fishing opportunities**

ICES advises that when the EU multiannual plan (MAP) for the Baltic Sea is applied, catches in 2023 that correspond to the F ranges in the plan are between 70 130 and 95 643 tonnes. The current advice applies to all catches from the stock, including those taken in Subdivision 28.1.

**Stock development over time**

Fishing pressure on the stock is above  $F_{MSY}$  and between  $F_{pa}$  and  $F_{lim}$  and that spawning-stock size is below  $MSY B_{trigger}$  and between  $B_{pa}$  and  $B_{lim}$ .

**Figure 1** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. Summary of the stock assessment. SSB at spawning time in 2022 is predicted.

# Conclusions #2

Fishing at an **F lower** than  $F_{MSY}$  in the long term can result in:

- Increased biomass
- Increased abundance of older/larger fish
- Very limited loss in long term catch
